The Second CREST-SBM International Conference

"Harmony of Gröbner bases and the modern industrial society" Osaka (Japan), June 28-July 2, 2010 <sup>a</sup> Supported by FQM-333, MTM2007-64509 and Feder

## Acknowledgments

I am very grateful to my colleagues F.J. Calderón-Moreno, L. Narváez-Macarro and J.M. Ucha-Enríquez for their constant help in my approach to this subject. I am also grateful to my former students J. Gago-Vargas and M.I. Hartillo-Hermoso for their useful comments.

D for differential.

#### D for differential.

# *D* for any ring of Linear Partial Differential Operators.

#### D for differential.

## *D* for any ring of Linear Partial Differential Operators.

A *D*-module is a module over the ring *D*. It represents a system of LPDE.

#### D for differential.

- *D* for any ring of Linear Partial Differential Operators.
  - Theory developed (from 1970) by I.N.
    - Bernstein, M. Kashiwara, T. Kawai,
- B. Malgrange, Z. Mebkhout, D. Quillen, M. Sato and others.

The system of LPDE

$$(1) \begin{cases} (x\frac{\partial}{\partial x} + 1)(u(x,y)) = 0\\ (y\frac{\partial}{\partial y} + 1)(u(x,y)) = 0 \end{cases}$$

The system of LPDE

$$(1) \begin{cases} (x\frac{\partial}{\partial x} + 1)(u(x,y)) = 0\\ (y\frac{\partial}{\partial y} + 1)(u(x,y)) = 0 \end{cases}$$

has no non-zero holomorphic solution (at the origin).

The system of LPDE

$$(1) \begin{cases} (x\frac{\partial}{\partial x} + 1)(u(x,y)) = 0\\ (y\frac{\partial}{\partial y} + 1)(u(x,y)) = 0 \end{cases}$$

But 
$$(x\partial_x + 1)(\frac{1}{xy}) = (y\partial_y + 1)(\frac{1}{xy}) = 0$$

The system of LPDE

$$(1) \begin{cases} (x\frac{\partial}{\partial x} + 1)(u(x,y)) = 0\\ (y\frac{\partial}{\partial y} + 1)(u(x,y)) = 0 \end{cases}$$

But 
$$(x\partial_x + 1)(\frac{1}{xy}) = (y\partial_y + 1)(\frac{1}{xy}) = 0$$

The meromorphic function  $\frac{1}{xy}$  is a solution of the system (1)

The system of LPDE

$$(1) \begin{cases} (x\frac{\partial}{\partial x} + 1)(u(x,y)) = 0\\ (y\frac{\partial}{\partial y} + 1)(u(x,y)) = 0 \end{cases}$$

But 
$$(x\partial_x + 1)(\frac{1}{xy}) = (y\partial_y + 1)(\frac{1}{xy}) = 0$$

The meromorphic function  $\frac{1}{xy}$  is a solution of the system (1) What does it look like the set of LPDO  $Q = Q(x, y, \partial_x, \partial_y)$ such that  $Q(\frac{1}{xy}) = 0$ ?

The system of LPDE

$$(1) \begin{cases} (x\frac{\partial}{\partial x} + 1)(u(x,y)) = 0\\ (y\frac{\partial}{\partial y} + 1)(u(x,y)) = 0 \end{cases}$$

But 
$$(x\partial_x + 1)(\frac{1}{xy}) = (y\partial_y + 1)(\frac{1}{xy}) = 0$$

The meromorphic function  $\frac{1}{xy}$  is a solution of the system (1) A kind of "inverse problem": The input is the solution  $\frac{1}{xy}$  and we want the set of equations  $Q(x, y, \partial_x, \partial_y)(u(x, y)) = 0$ having  $u(x, y) = \frac{1}{xy}$  as a solution.

 $x = (x_1, \ldots, x_n)$  indeterminates  $(n \in \mathbb{Z}_{\geq 1})$  $\mathbb{C}[x] = \mathbb{C}[x_1, \ldots, x_n]$  polynomial ring.

$$x = (x_1, \dots, x_n)$$
 indeterminates  $(n \in \mathbb{Z}_{\geq 1})$   
 $\mathbb{C}[x] = \mathbb{C}[x_1, \dots, x_n]$  polynomial ring.  
 $\partial_i = \frac{\partial}{\partial x_i}, \ \partial = (\partial_1, \dots, \partial_n).$ 

 $x = (x_1, \dots, x_n)$  indeterminates  $(n \in \mathbb{Z}_{\geq 1})$  $\mathbb{C}[x] = \mathbb{C}[x_1, \dots, x_n]$  polynomial ring.  $\partial_i = \frac{\partial}{\partial x_i}, \ \partial = (\partial_1, \dots, \partial_n).$ 

LPDO  $P = \sum_{\beta} p_{\beta}(x) \partial^{\beta}$  (finite sum)  $\beta \in \mathbb{N}^{n}, \ p_{\beta}(x) \in \mathbb{C}[x].$ 

 $x = (x_1, \dots, x_n)$  indeterminates  $(n \in \mathbb{Z}_{\geq 1})$  $\mathbb{C}[x] = \mathbb{C}[x_1, \dots, x_n]$  polynomial ring.  $\partial_i = \frac{\partial}{\partial x_i}, \ \partial = (\partial_1, \dots, \partial_n).$ 

LPDO  $P = \sum_{\beta} p_{\beta}(x) \partial^{\beta}$  (finite sum)  $\beta \in \mathbb{N}^{n}, \ p_{\beta}(x) \in \mathbb{C}[x].$ 

$$\partial^{\beta} = \partial_1^{\beta_1} \cdots \partial_n^{\beta_n} = \frac{\partial^{\beta_1 + \cdots + \beta_n}}{\partial x_1^{\beta_1} \cdots \partial x_n^{\beta_n}}$$

 $x = (x_1, \dots, x_n)$  indeterminates  $(n \in \mathbb{Z}_{\geq 1})$  $\mathbb{C}[x] = \mathbb{C}[x_1, \dots, x_n]$  polynomial ring.  $\partial_i = \frac{\partial}{\partial x_i}, \ \partial = (\partial_1, \dots, \partial_n).$ 

LPDO  $P = \sum_{\beta} p_{\beta}(x) \partial^{\beta}$  (finite sum)  $\beta \in \mathbb{N}^{n}, \ p_{\beta}(x) \in \mathbb{C}[x].$ 

 $A_n = A_n(\mathbb{C})$  the set of LPDO (with polynomial coefficients).

 $x = (x_1, \dots, x_n)$  indeterminates  $(n \in \mathbb{Z}_{\geq 1})$  $\mathbb{C}[x] = \mathbb{C}[x_1, \dots, x_n]$  polynomial ring.  $\partial_i = \frac{\partial}{\partial x_i}, \ \partial = (\partial_1, \dots, \partial_n).$ 

LPDO  $P = \sum_{\beta} p_{\beta}(x) \partial^{\beta}$  (finite sum)  $\beta \in \mathbb{N}^{n}, \ p_{\beta}(x) \in \mathbb{C}[x].$ 

 $A_n = A_n(\mathbb{C})$  the set of LPDO (with polynomial coefficients). LPDO can be added (obvious way) and also multiplied: the product PQ is computed by applying Leibniz's rule:

 $x = (x_1, \dots, x_n)$  indeterminates  $(n \in \mathbb{Z}_{\geq 1})$  $\mathbb{C}[x] = \mathbb{C}[x_1, \dots, x_n]$  polynomial ring.  $\partial_i = \frac{\partial}{\partial x_i}, \ \partial = (\partial_1, \dots, \partial_n).$ 

LPDO  $P = \sum_{\beta} p_{\beta}(x) \partial^{\beta}$  (finite sum)  $\beta \in \mathbb{N}^{n}, \ p_{\beta}(x) \in \mathbb{C}[x].$ 

 $A_n = A_n(\mathbb{C})$  the set of LPDO (with polynomial coefficients). LPDO can be added (obvious way) and also multiplied: the product PQ is computed by applying Leibniz's rule:

$$\partial_i f = f \partial_i + \frac{\partial f}{\partial x_i}$$
 (for  $f \in \mathbb{C}[x]$ ).

 $x = (x_1, \dots, x_n)$  indeterminates  $(n \in \mathbb{Z}_{\geq 1})$  $\mathbb{C}[x] = \mathbb{C}[x_1, \dots, x_n]$  polynomial ring.  $\partial_i = \frac{\partial}{\partial x_i}, \ \partial = (\partial_1, \dots, \partial_n).$ 

LPDO  $P = \sum_{\beta} p_{\beta}(x) \partial^{\beta}$  (finite sum)  $\beta \in \mathbb{N}^{n}, \ p_{\beta}(x) \in \mathbb{C}[x].$ 

 $A_n = A_n(\mathbb{C})$  the set of LPDO (with polynomial coefficients). LPDO can be added (obvious way) and also multiplied: the product PQ is computed by applying Leibniz's rule:

$$\partial_i f = f \partial_i + \frac{\partial f}{\partial x_i}$$
 (for  $f \in \mathbb{C}[x]$ ).

 $A_n$  is a (non-commutative) ring (the Weyl algebra).

Problem 1. Given  $0 \neq f \in \mathbb{C}[x]$  *Compute* the set  $\{P \in A_n \mid P(\frac{1}{f}) = 0\}.$ 

Problem 1. Given  $0 \neq f \in \mathbb{C}[x]$  *Compute* the set  $\{P \in A_n \mid P(\frac{1}{f}) = 0\}.$ Previous set is a (left) ideal in the ring  $A_n$ . It is denoted  $Ann(\frac{1}{f})$ the annihilating ideal of  $\frac{1}{f}$ .

Problem 1. Given  $0 \neq f \in \mathbb{C}[x]$  *Compute* the set  $\{P \in A_n \mid P(\frac{1}{f}) = 0\}.$ Previous set is a (left) ideal in the ring  $A_n$ . It is denoted  $Ann(\frac{1}{f})$ the annihilating ideal of  $\frac{1}{f}$ . (Noetherianity: Hilbert's basis Th.) Any (left) ideal in  $A_n$  is finitely generated.

**Problem 1.** Given  $0 \neq f \in \mathbb{C}[x]$ *Compute* the set  $\{P \in A_n \mid P(\frac{1}{f}) = 0\}.$ Previous set is a (left) ideal in the ring  $A_n$ . It is denoted  $Ann(\frac{1}{f})$ the annihilating ideal of  $\frac{1}{f}$ . (Noetherianity: Hilbert's basis Th.) Any (left) ideal in  $A_n$  is finitely generated. (T. Oaku, N. Takayama) Describe an algorithm solving Problem 1.

**Problem 1.** Given  $0 \neq f \in \mathbb{C}[x]$ *Compute* the set  $\{P \in A_n \mid P(\frac{1}{f}) = 0\}.$ Previous set is a (left) ideal in the ring  $A_n$ . It is denoted  $Ann(\frac{1}{f})$ the annihilating ideal of  $\frac{1}{f}$ . (Noetherianity: Hilbert's basis Th.) Any (left) ideal in  $A_n$  is finitely generated. (T. Oaku, N. Takayama) Describe an algorithm solving Problem 1. Input: A non zero polynomial  $f \in \mathbb{C}[x]$ . Output: A finite generating system for the ideal  $Ann(\frac{1}{f})$ .

As many algorithms in Algebraic Geometry their complexity is double exponential.

No general alternative methods to compute  $Ann(\frac{1}{f})$  are known.

**Ex.**: f = xyz(x+y)(x+z)(y+z)(x+y+z).

Macaulay 2: RatAnn f computes  $Ann(\frac{1}{f})$ . But for this

example, in my computer, Macaulay2 gives
 \*\*\* out of memory, exiting \*\*\*.

#### **Nevertheless**

Nevertheless, we can prove that  $Ann(\frac{1}{f})$  is generated by the three operators  $P_1, P_2, P_3$ 

#### **Nevertheless**

$$P_1 = x\partial_x + y\partial_y + z\partial_z + 7$$

 $P_2 = y(x+y)(y+z)\partial_y - z(x+z)(y+z)\partial_z + (y-z)(x+4y+4z)$ 

 $P_3 = y(x-y)(x+y)\partial_y + z(x+z)(x+3y+3z)\partial_z + 3x^2 + 5xy - 4y^2 + 8xz + 8yz + 8z^2$ 

#### **Nevertheless**

$$P_1 = x\partial_x + y\partial_y + z\partial_z + 7$$

 $P_2 = y(x+y)(y+z)\partial_y - z(x+z)(y+z)\partial_z + (y-z)(x+4y+4z)$ 

 $P_{3} = y(x - y)(x + y)\partial_{y} + z(x + z)(x + 3y + 3z)\partial_{z} + 3x^{2} + 5xy - 4y^{2} + 8xz + 8yz + 8z^{2}$ 

How to prove that?

If  $f \in \mathbb{C}$  (and  $f \neq 0$ ) then  $Ann(\frac{1}{f}) = A_n(\partial_1, \dots, \partial_n)$ .

Assume f is not a constant polynomial.

Assume *P* is a first order operator  $P = \sum_{i=1}^{n} p_i(x)\partial_i + p_0(x)$   $p_i(x) \in \mathbb{C}[x].$ 

Assume *P* is a first order operator  $P = \sum_{i=1}^{n} p_i(x)\partial_i + p_0(x)$   $p_i(x) \in \mathbb{C}[x].$ 

Remark:  $P(\frac{1}{f}) = 0$  if and only if  $\sum_{i=1}^{n} p_i(x) \frac{\partial f}{\partial x_i} = p_0(x) f$ .

Assume *P* is a first order operator  $P = \sum_{i=1}^{n} p_i(x)\partial_i + p_0(x)$   $p_i(x) \in \mathbb{C}[x].$ 

Remark:  $P(\frac{1}{f}) = 0$  if and only if  $\sum_{i=1}^{n} p_i(x) \frac{\partial f}{\partial x_i} = p_0(x) f$ .

(K. Saito): The vector field  $\sum p_i(x)\partial_i$  is called *logarithmic* w.r.t. f.

Assume *P* is a first order operator  $P = \sum_{i=1}^{n} p_i(x)\partial_i + p_0(x)$   $p_i(x) \in \mathbb{C}[x].$ 

Remark:  $P(\frac{1}{f}) = 0$  if and only if  $\sum_{i=1}^{n} p_i(x) \frac{\partial f}{\partial x_i} = p_0(x) f$ .

(K. Saito): The vector field  $\sum p_i(x)\partial_i$  is called *logarithmic* w.r.t. f.

Ex.:  $f\partial_i$  is a logarithmic vector field (for i = 1, ..., n) w.r.t. fand  $f\partial_i + \partial_i(f)$  annihilates  $\frac{1}{f}$ .

(K. Saito):  $Der(\log f)$  the set of logarithmic vector field (with respect to f).

(K. Saito):  $Der(\log f)$  the set of logarithmic vector field (with respect to f).

 $\delta = \sum_{i} p_{i}(x) \partial_{i} \in Der(\log f) \text{ if and only if}$   $\delta(f) = \sum_{i} p_{i}(x) \partial_{i}(f) = p_{0}(x) f$ for some  $p_{0}(x) \in \mathbb{C}[x]$ . Notice that  $p_{0}(x) = \frac{\delta(f)}{f}$ .

(K. Saito):  $Der(\log f)$  the set of logarithmic vector field (with respect to f).

 $\delta = \sum_{i} p_{i}(x) \partial_{i} \in Der(\log f) \text{ if and only if}$   $\delta(f) = \sum_{i} p_{i}(x) \partial_{i}(f) = p_{0}(x) f$ for some  $p_{0}(x) \in \mathbb{C}[x]$ . Notice that  $p_{0}(x) = \frac{\delta(f)}{f}$ .  $\widetilde{Der}(\log f) = \{\delta + \frac{\delta(f)}{f} \mid \delta \in Der(\log f)\}$ 

(K. Saito):  $Der(\log f)$  the set of logarithmic vector field (with respect to f).

 $\delta = \sum_{i} p_{i}(x) \partial_{i} \in Der(\log f) \text{ if and only if}$   $\delta(f) = \sum_{i} p_{i}(x) \partial_{i}(f) = p_{0}(x) f$ for some  $p_{0}(x) \in \mathbb{C}[x]$ . Notice that  $p_{0}(x) = \frac{\delta(f)}{f}$ .  $\widetilde{Der}(\log f) = \{\delta + \frac{\delta(f)}{f} \mid \delta \in Der(\log f)\}$ 

Denote  $Ann^{(1)}(\frac{1}{f})$  the ideal in  $A_n$  generated by LPDO *P* of order 1 and  $P(\frac{1}{f}) = 0$ .

(K. Saito):  $Der(\log f)$  the set of logarithmic vector field (with respect to f).

 $\delta = \sum_{i} p_{i}(x) \partial_{i} \in Der(\log f) \text{ if and only if}$   $\delta(f) = \sum_{i} p_{i}(x) \partial_{i}(f) = p_{0}(x) f$ for some  $p_{0}(x) \in \mathbb{C}[x]$ . Notice that  $p_{0}(x) = \frac{\delta(f)}{f}$ .  $\widetilde{Der}(\log f) = \{\delta + \frac{\delta(f)}{f} \mid \delta \in Der(\log f)\}$ 

Denote  $Ann^{(1)}(\frac{1}{f})$  the ideal in  $A_n$  generated by LPDO P of order 1 and  $P(\frac{1}{f}) = 0$ . Remark:  $Ann^{(1)}(\frac{1}{f}) = A_n \widetilde{Der}(\log f)$ .

(K. Saito):  $Der(\log f)$  the set of logarithmic vector field (with respect to f).

 $\delta = \sum_{i} p_{i}(x) \partial_{i} \in Der(\log f) \text{ if and only if}$   $\delta(f) = \sum_{i} p_{i}(x) \partial_{i}(f) = p_{0}(x) f$ for some  $p_{0}(x) \in \mathbb{C}[x]$ . Notice that  $p_{0}(x) = \frac{\delta(f)}{f}$ .  $\widetilde{Der}(\log f) = \{\delta + \frac{\delta(f)}{f} \mid \delta \in Der(\log f)\}$ 

Denote  $Ann^{(1)}(\frac{1}{f})$  the ideal in  $A_n$  generated by LPDO P of order 1 and  $P(\frac{1}{f}) = 0$ .  $Ann^{(1)}(\frac{1}{f}) \subset Ann(\frac{1}{f})$ 

(K. Saito):  $Der(\log f)$  the set of logarithmic vector field (with respect to f).

 $\delta = \sum_{i} p_{i}(x) \partial_{i} \in Der(\log f) \text{ if and only if}$   $\delta(f) = \sum_{i} p_{i}(x) \partial_{i}(f) = p_{0}(x) f$ for some  $p_{0}(x) \in \mathbb{C}[x]$ . Notice that  $p_{0}(x) = \frac{\delta(f)}{f}$ .  $\widetilde{Der}(\log f) = \{\delta + \frac{\delta(f)}{f} \mid \delta \in Der(\log f)\}$ 

Denote  $Ann^{(1)}(\frac{1}{f})$  the ideal in  $A_n$  generated by LPDO P of order 1 and  $P(\frac{1}{f}) = 0$ .

Problem 2. Describe (characterize) the class of nonzero  $f \in \mathbb{C}[x]$  such that  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f}).$ 

Ex.: 
$$n = 1, x = x_1$$
.  
 $Ann^{(1)}(\frac{1}{x}) = Ann(\frac{1}{x}) = A_1(x\partial_x + 1)$ .

**Ex.:**  $n = 2, x = x_1, y = x_2$ .  $Ann^{(1)}(\frac{1}{xy}) = Ann(\frac{1}{xy}) = A_2(x\partial_x + 1, y\partial_y + 1)$ .

**Ex.**: 
$$n = 2$$
,  $x = x_1, y = x_2$ .  
 $Ann^{(1)}(\frac{1}{x-y^2}) = Ann(\frac{1}{x-y^2}) = Ann(\frac{$ 

**Ex.**: n = 2,  $Ann^{(1)}(\frac{1}{x^4+y^5+xy^4}) \rightleftharpoons Ann(\frac{1}{x^4+y^5+xy^4}).$ 

 $Der(\log f) \longrightarrow Syz(\partial_1(f), \ldots, \partial_n(f), f)$ 

$$Der(\log f) \longrightarrow Syz(\partial_1(f), \dots, \partial_n(f), f)$$
$$\delta = \sum_i p_i(x)\partial_i \mapsto (p_1(x), \dots, p_n(x), -\frac{\delta(f)}{f}).$$

$$Der(\log f) \longrightarrow Syz(\partial_1(f), \dots, \partial_n(f), f)$$

$$\delta = \sum_{i} p_i(x) \partial_i \mapsto (p_1(x), \dots, p_n(x), -\frac{\delta(f)}{f}).$$

Previous map is an isomorphism of  $\mathbb{C}[x]$ -modules. So, object  $Der(\log f)$  is computable.

By using commutative Groebner basis computation in the polynomial ring  $\mathbb{C}[x]$ .

$$Der(\log f) \longrightarrow Syz(\partial_1(f), \dots, \partial_n(f), f)$$

$$\delta = \sum_{i} p_i(x) \partial_i \mapsto (p_1(x), \dots, p_n(x), -\frac{\delta(f)}{f}).$$

Previous map is an isomorphism of  $\mathbb{C}[x]$ -modules. So, object  $Der(\log f)$  is computable.

By using commutative Groebner basis computation in the polynomial ring  $\mathbb{C}[x]$ .

 $Ann^{(1)}(\frac{1}{f})$  is computable (using *only* commutative Groebner bases algorithms; which also have double exponential complexity).

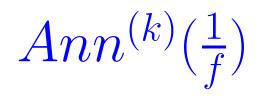

$$Der(\log f) \longrightarrow Syz(\partial_1(f), \dots, \partial_n(f), f)$$

$$\delta = \sum_{i} p_i(x) \partial_i \mapsto (p_1(x), \dots, p_n(x), -\frac{\delta(f)}{f}).$$

Previous map is an isomorphism of  $\mathbb{C}[x]$ -modules. So, object  $Der(\log f)$  is computable. By using commutative Groebner basis computation in the

By using commutative Groebner basis computation in the polynomial ring  $\mathbb{C}[x]$ .

In practice  $Ann^{(1)}(\frac{1}{f})$  is easier to compute than  $Ann(\frac{1}{f})$ .

 $Ann^{(k)}(\frac{1}{f})$ 

$$k \in \mathbb{Z}_{\geq 1}$$
.  $Ann^{(k)}(\frac{1}{f})$   
ideal in  $A_n$  generated by LPDO  $P$  such that  
 $P(\frac{1}{f}) = 0$  and  $ord(P) \leq k$ .

 $Ann^{(k)}(\frac{1}{f})$ 

$$k \in \mathbb{Z}_{\geq 1}$$
.  $Ann^{(k)}(\frac{1}{f})$   
ideal in  $A_n$  generated by LPDO  $P$  such that  
 $P(\frac{1}{f}) = 0$  and  $ord(P) \leq k$ .

 $Ann^{(k)}(\frac{1}{f})$  is also computable (using only commutative Groebner basis algorithms).

 $Ann^{(k)}(\frac{1}{f})$ 

$$k \in \mathbb{Z}_{\geq 1}. \ Ann^{(k)}(\frac{1}{f})$$
  
ideal in  $A_n$  generated by LPDO  $P$  such that  
 $P(\frac{1}{f}) = 0$  and  $ord(P) \leq k$ .  
 $Ann^{(k)}(\frac{1}{f})$  is also computable (using only commutative  
Groebner basis algorithms).  
Ex.:  $P = \sum_{i \leq j} p_{ij}(x)\partial_i\partial_j + \sum_i p_i(x)\partial_i + p_0(x)$   
 $P(\frac{1}{f}) = 0$  if and only if  
the coefficients  $(p_{ij}(x), p_i(x), p_0(x))$  represent a syzygy  
among  $f^2$  and a set of expressions in the partial derivatives  
of  $f$  up to degree 2.

 $Ann^{(k)}(\frac{1}{f})$ 

$$k \in \mathbb{Z}_{\geq 1}$$
.  $Ann^{(k)}(\frac{1}{f})$   
ideal in  $A_n$  generated by LPDO  $P$  such that  
 $P(\frac{1}{f}) = 0$  and  $ord(P) \leq k$ .

 $Ann^{(k)}(\frac{1}{f})$  is also computable (using only commutative Groebner basis algorithms).

$$Ann^{(1)}(\frac{1}{f}) \subset Ann^{(2)}(\frac{1}{f}) \subset \dots \subset Ann^{(k)}(\frac{1}{f}) \subset \dots \subset Ann(\frac{1}{f}).$$

 $Ann^{(k)}(\frac{1}{f})$ 

 $k \in \mathbb{Z}_{\geq 1}$ .  $Ann^{(k)}(\frac{1}{f})$ ideal in  $A_n$  generated by LPDO P such that  $P(\frac{1}{f}) = 0$  and  $ord(P) \leq k$ .  $Ann^{(k)}(\frac{1}{f})$  is also computable (using only commutative Groebner basis algorithms). (Noetherianity): There exists a minimal integer  $k \geq 1$ (k = k(f) depending on f) such that  $Ann^{(k)}(\frac{1}{f}) = Ann(\frac{1}{f})$ .

 $Ann^{(k)}(\frac{1}{f})$ 

$$k \in \mathbb{Z}_{\geq 1}$$
.  $Ann^{(k)}(\frac{1}{f})$   
ideal in  $A_n$  generated by LPDO  $P$  such that  
 $P(\frac{1}{f}) = 0$  and  $ord(P) \leq k$ .

 $Ann^{(k)}(\frac{1}{f})$  is also computable (using only commutative Groebner basis algorithms).

(Noetherianity): There exists a minimal integer  $k \ge 1$  (k = k(f) depending on f) such that  $Ann^{(k)}(\frac{1}{f}) = Ann(\frac{1}{f}).$ 

Problem 3. Describe the behavior of the function  $0 \neq f \in \mathbb{C}[x] \mapsto k(f)$ .

From now on, we assume f is a reduced nonzero polynomial in  $\mathbb{C}[x]$ .  $\Omega^p$  differential p-forms with polynomial coefficients,  $p \in \mathbb{N}$ .

 $\Omega^p(1/f)$  meromorphic differential *p*-forms with poles along  $f = 0, p \in \mathbb{N}$ .

 $\Omega^p(1/f)$  meromorphic differential *p*-forms with poles along  $f = 0, p \in \mathbb{N}$ . (E. Brieskorn) The cohomology of  $\Omega^{\bullet}(1/f)$ is computable if *f* is an *arrangement of hyperplanes*.

 $\Omega^p(1/f)$  meromorphic differential *p*-forms with poles along  $f = 0, p \in \mathbb{N}$ .

(E. Brieskorn) The cohomology of  $\Omega^{\bullet}(1/f)$  is computable if f is an *arrangement of hyperplanes*.

(T. Oaku, N.Takayama) For any nonzero polynomial  $f \in \mathbb{C}[x]$ , the cohomology of  $\Omega^{\bullet}(1/f)$  is computable.

 $\Omega^p(1/f) \supset \Omega^p(\log f)$  logarithmic differential *p*-forms (w.r.t. *f*).

 $\Omega^p(1/f) \supset \Omega^p(\log f)$  logarithmic differential *p*-forms (w.r.t. *f*).

(K. Saito):  $\omega \in \Omega^p(1/f)$  is said to be logarithmic (w.r.t. f) if  $f\omega$  and  $fd\omega$  have no poles.

 $\Omega^p(1/f) \supset \Omega^p(\log f)$  logarithmic differential *p*-forms (w.r.t. *f*).

(K. Saito):  $\omega \in \Omega^p(1/f)$  is said to be logarithmic (w.r.t. f) if  $f\omega$  and  $fd\omega$  have no poles.

Ex.:  $\frac{dx}{x}$  and  $\frac{dy}{y}$  are logarithmic 1-forms (w.r.t. f = xy).  $\frac{dx}{x^2}$ ,  $\frac{dx}{y}$  are not.

 $\Omega^p(1/f) \supset \Omega^p(\log f)$  logarithmic differential *p*-forms (w.r.t. *f*).

(K. Saito):  $\omega \in \Omega^p(1/f)$  is said to be logarithmic (w.r.t. f) if  $f\omega$  and  $fd\omega$  have no poles.

The inclusion  $i_f : \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a morphism of complexes (both with the exterior derivative).

 $\Omega^p(1/f) \supset \Omega^p(\log f)$  logarithmic differential *p*-forms (w.r.t. *f*).

(K. Saito):  $\omega \in \Omega^p(1/f)$  is said to be logarithmic (w.r.t. f) if  $f\omega$  and  $fd\omega$  have no poles.

The inclusion  $i_f : \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a morphism of complexes (both with the exterior derivative).

Problem 4. Describe an algorithm computing the cohomology of the logarithmic complex  $\Omega^{\bullet}(\log f)$  for a given nonzero polynomial f.

 $\Omega^p(1/f) \supset \Omega^p(\log f)$  logarithmic differential *p*-forms (w.r.t. *f*).

(K. Saito):  $\omega \in \Omega^p(1/f)$  is said to be logarithmic (w.r.t. f) if  $f\omega$  and  $fd\omega$  have no poles.

The inclusion  $i_f : \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a morphism of complexes (both with the exterior derivative).

Problem 4. Describe an algorithm computing the cohomology of the logarithmic complex  $\Omega^{\bullet}(\log f)$  for a given nonzero polynomial f.

(N. Takayama- F.J.C.J.) Positive solution to Problem 4 if n = 2.

#### **Logarithmic Comparison Theorem**

Problem 5. Describe the class of nonzero polynomial f such that  $i_f: \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$ is a quasi-isomorphism. **Logarithmic Comparison Theorem** 

Problem 5. Describe the class of nonzero polynomial f such that  $i_f: \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$ is a quasi-isomorphism. quasi-isomorphism  $\equiv$  induces an isomorphism in cohomology.

**Logarithmic Comparison Theorem** 

Problem 5. Describe the class of nonzero polynomial f such that  $i_f: \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$ is a quasi-isomorphism. If so, we say that the Logarithmic Comparison Property (LCP) holds for f (or for f = 0).

(J.M. Ucha-F.J.C.J.) For (Spencer + free) polynomials  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f})$  in and only if  $i_f: \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a quasi-isomorphism.

(J.M. Ucha-F.J.C.J.) For (Spencer + free) polynomials  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f})$  in and only if  $i_f: \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a quasi-isomorphism.

Freeness is computable (related to Quillen-Suslin Th.). Spencer property is computable (with Groebner basis in  $A_n$ ).

(J.M. Ucha-F.J.C.J.) For (Spencer + free) polynomials  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f})$  in and only if  $i_f: \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a quasi-isomorphism.

The class (Spencer + free) strictly contains

- all non constant f(x, y) (K. Saito; F. Calderón) and
- all free arrangement of hyperplanes in  $\mathbb{C}^n$  (for  $n \in \mathbb{N}$ ) (F. Calderón-L. Narváez).

(J.M. Ucha-F.J.C.J.) For (Spencer + free) polynomials  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f})$  in and only if  $i_f: \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a quasi-isomorphism.

The class (Spencer + free) strictly contains

• all non constant f(x, y) (K. Saito; F. Calderón) and • all free arrangement of hyperplanes in  $\mathbb{C}^n$  (for  $n \in \mathbb{N}$ ) (F.

Calderón-L. Narváez).

f = xyz(x+y)(x+z)(y+z)(x+y+z) if free and Spencer. f = xyz(x+y+z) is Spencer but not free.  $f = (x+yz)(x^4+y^5+xy^4)$  is free but not Spencer (F. Calderón-L. Narváez).

(J.M. Ucha-F.J.C.J.) For (Spencer + free) polynomials  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f})$  in and only if  $i_f: \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a quasi-isomorphism.

The class (Spencer + free) strictly contains

• all non constant f(x, y) (K. Saito; F. Calderón) and • all free arrangement of hyperplanes in  $\mathbb{C}^n$  (for  $n \in \mathbb{N}$ ) (F.

Calderón-L. Narváez).

f = xyz(x+y)(x+z)(y+z)(x+y+z) if free and Spencer. f = xyz(x+y+z) is Spencer but not free.  $f = (x+yz)(x^4+y^5+xy^4)$  is free but not Spencer (F. Calderón-L. Narváez).

f = xyz(x + y)(x + z)(y + z)(x + y + z)

f = xyz(x+y)(x+z)(y+z)(x+y+z) is Spencer + free

f = xyz(x + y)(x + z)(y + z)(x + y + z)

$$f = xyz(x+y)(x+z)(y+z)(x+y+z)$$
 is Spencer + free

$$f = xyz(x+y)(x+z)(y+z)(x+y+z)$$

$$f = xyz(x+y)(x+z)(y+z)(x+y+z)$$
 is Spencer + free

So 
$$Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f}).$$

$$f = xyz(x+y)(x+z)(y+z)(x+y+z)$$

$$f = xyz(x+y)(x+z)(y+z)(x+y+z)$$
 is Spencer + free

So 
$$Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f}).$$

Compute  $Der(\log f)$  via  $Syz(f'_x, f'_y, f'_z, f)$  (Groebner basis in  $\mathbb{C}[x, y, z]$ ).

$$f = xyz(x+y)(x+z)(y+z)(x+y+z)$$

$$f = xyz(x+y)(x+z)(y+z)(x+y+z)$$
 is Spencer + free

So 
$$Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f}).$$

By a computation with Macaulay2,  $Der(\log f)$  is generated by  $\delta_1 = x\partial_x + y\partial_y + z\partial_z$ 

$$\delta_2 = y(x+y)(y+z)\partial_y - z(x+z)(y+z)\partial_z$$

 $\delta_3 = y(x-y)(x+y)\partial_y + z(x+z)(x+3y+3z)\partial_z$ 

$$f = xyz(x+y)(x+z)(y+z)(x+y+z)$$

$$f = xyz(x+y)(x+z)(y+z)(x+y+z)$$
 is Spencer + free

So 
$$Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f}).$$

Then (as announced some slides before)  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f}) \text{ is generated by}$   $P1 = x\partial_x + y\partial_y + z\partial_z + 7$   $P_2 = y(x+y)(y+z)\partial_y - z(x+z)(y+z)\partial_z + (y-z)(x+4y+4z)$   $P_3 = y(x-y)(x+y)\partial_y + z(x+z)(x+3y+3z)\partial_z + 3x^2 + 5xy - 4y^2 + 8xz + 8yz + 8z^2$ 

# Homo sapiens invented the natural numbers $(\mathbb{N})$ to count things.

When computations became hard to achieve *homo sapiens* invented Mathematics.

Computer Algebra is a powerful tool in Mathematics (and in particular in *D*-modules theory).

Modern Industrial Society needs to do big/heavy computations. In order to simplify them (and essentially –at least in *D*-module theory– all non trivial computation are heavy)

Modern Industrial Society needs to do big/heavy computations. In order to simplify them (and essentially –at least in D-module theory– all non trivial computation are heavy) we must use meaningful and deep mathematical ideas and results.

Modern Industrial Society needs to do big/heavy computations. In order to simplify them (and essentially –at least in D-module theory– all non trivial computation are heavy) Testing equality  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f})$  is a modest and clear example of such tautology.

#### Thank you very much.

#### **Additional results**

- The following slides give more precise results
- on the subject of the talk.

(K. Saito)  $f \in \mathbb{C}[x]$  (non constant) defines a free hypersurface (in  $\mathbb{C}^n$ ) if the module  $Der(\log f)$  is a free  $\mathbb{C}[x]$ -module. If so, we also say that f is free.

(K. Saito)  $f \in \mathbb{C}[x]$  (non constant) defines a free hypersurface (in  $\mathbb{C}^n$ ) if the module  $Der(\log f)$  is a free  $\mathbb{C}[x]$ -module. If so, we also say that f is free.

(K. Saito)  $f \in \mathbb{C}[x]$  (non constant) defines a free hypersurface (in  $\mathbb{C}^n$ ) if the module  $Der(\log f)$  is a free  $\mathbb{C}[x]$ -module. If so, we also say that f is free. (K. Saito) Any non constant polynomial in two variables f(x, y) is free.

(K. Saito)  $f \in \mathbb{C}[x]$  (non constant) defines a free hypersurface (in  $\mathbb{C}^n$ ) if the module  $Der(\log f)$  is a free  $\mathbb{C}[x]$ -module. If so, we also say that f is free. f = xyz(x+y)(x+z)(y+z)(x+y+z) is free.

(K. Saito)  $f \in \mathbb{C}[x]$  (non constant) defines a free hypersurface (in  $\mathbb{C}^n$ ) if the module  $Der(\log f)$  is a free  $\mathbb{C}[x]$ -module. If so, we also say that f is free. f = xyz(x + z + z) is not free.

(K. Saito)  $f \in \mathbb{C}[x]$  (non constant) defines a free hypersurface (in  $\mathbb{C}^n$ ) if the module  $Der(\log f)$  is a free  $\mathbb{C}[x]$ -module. If so, we also say that f is free. Freeness is computable (K. Saito's criterion + effective Quillen-Suslin).

#### LCT

(L. Narváez, D. Mond, F.J.C.J.) If f = 0 is a free and locally quasi-homogeneous hypersurface (in  $\mathbb{C}^n$ ) then f satisfies LCP.

#### LCT

(L. Narváez, D. Mond, F.J.C.J.) If f = 0 is a free and locally quasi-homogeneous hypersurface (in  $\mathbb{C}^n$ ) then f satisfies LCP.

So, for this class of f, by using Oaku-Takayama algorithm,  $H^p(\Omega^{\bullet}(\log f)) = H^p(\Omega^{\bullet}(1/f))$  is computable for all p.

#### LCT

(L. Narváez, D. Mond, F.J.C.J.) If f = 0 is a free and locally quasi-homogeneous hypersurface (in  $\mathbb{C}^n$ ) then f satisfies LCP.

So, for this class of f, by using Oaku-Takayama algorithm,  $H^p(\Omega^{\bullet}(\log f)) = H^p(\Omega^{\bullet}(1/f))$  is computable for all p. So, for

this class of f, we have a positive solution of Problem 4 (the cohomology of  $\Omega^{\bullet}(\log f)$  is computable)

#### Free + Locally Quasi-homogeneous?

How big is the class  $\{f \in \mathbb{C}[x] \mid \text{free} + \text{locally quasi-homogeneous} \}$ ?

#### Free + Locally Quasi-homogeneous?

How big is the class  $\{f \in \mathbb{C}[x] \mid \text{free} + \text{locally quasi-homogeneous} \}$ ? Previous

class strictly includes: a) all the free hyperplane arrangements.

b) all locally quasi-homogeneous plane curves f(x, y) = 0.

#### LCT for curves

(F.J. Calderón, L. Narváez, D. Mond, F.J.C.J.) If f(x, y) = 0 is a (reduced) plane curve then f satisfies LCP if and only if and all its singularities are quasi-homogeneous.

#### LCT for curves

(F.J. Calderón, L. Narváez, D. Mond, F.J.C.J.) If f(x, y) = 0 is a (reduced) plane curve then f satisfies LCP if and only if and all its singularities are quasi-homogeneous.  $f = x^4 + y^5 + xy^4 = 0$  has a non quasi-homogeneous singularity at the origin. Since f is free then f does not satisfy LCP. Since f is Spencer  $Ann^{(1)}(\frac{1}{f}) \subsetneqq Ann(\frac{1}{f})$ .

#### **Torelli's conjecture**

Conjecture. For any nonzero polynomial  $f \in \mathbb{C}[x]$ ,  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f})$  if and only if  $i_f : \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a quasi-isomorphism.

#### **Torelli's conjecture**

Conjecture. For any nonzero polynomial  $f \in \mathbb{C}[x]$ ,  $Ann^{(1)}(\frac{1}{f}) = Ann(\frac{1}{f})$  if and only if  $i_f: \Omega^{\bullet}(\log f) \to \Omega^{\bullet}(1/f)$  is a quasi-isomorphism. (J.M. Ucha-F.J.C.J.) If  $f \in \mathbb{C}[x]$  is (Spencer + free) then previous conjecture is satisfied.
